

# Download Marine Food Chain For Kids

In a typical marine food chain, dinoflagellates convert energy from sunlight into food through photosynthesis and store it in their tissues. Copepods feed on dinoflagellates and incorporate this energy into their own tissues. The energy is transferred to sunfish when they feed on copepods, to small sharks that feed on sunfish,...

Understanding Our Ocean's Food Chain For Kids. Some of these are fish themselves, but they tend to be bigger, like sardines and herring. There are also cephalopods, which are creatures like squid, octopuses, and cuttlefish. The large fish in this category eat small fish from the next level. The cephalopods might eat small fish, as well as shelled creatures like shrimp and lobsters. Take a look at the lesson called Marine Food Chain Lesson for Kids if you would like to learn more about water regions. This lesson will help you learn how to:

Name some marine carnivores  
A food web is similar to a food chain, but it shows how multiple food chains can be connected to each other.  
Marine Producers  
A producer is a living thing that uses sunlight to create its own food ... - Marine Food Chain For Kids
