A relational database stores all data in tables on a server. Clients talk to such servers using SQL statements such as "select \* from actors". Data is also created and updated using SQL. VelocityDB is not a relational database (but it is very good at managing relations!), with VelocityDB C# objects are stored as objects with all references/relations between the objects. An object-relational database (ORD), or object-relational database management system (ORDBMS), is a database management system (DBMS) similar to a relational database, but with an object-oriented database model: objects, classes and inheritance are directly supported in database schemas and in the query language. In addition, just as with pure relational systems, it supports extension of the ... - Nested Relations And Complex Objects In Databases
